- Linux is technically a ***kernel***
  - ***Kernel -*** core of the operating system

- Many operating systems use the Linux kernel!
  - Ubuntu (what's on the EOS machines)
  - Arch, Kali, Gentoo, Fedora, Manjaro, etc.
- Confusingly, these OS's are often referred to as "Linux"

And now, what is Unix???

And now, what is Unix???

- Unix was an earlier operating system

And now, what is Unix???

- Unix was an earlier operating system
- Linux and other systems are heavily influenced by Unix

And now, what is Unix???

- Unix was an earlier operating system
- Linux and other systems are heavily influenced by Unix
- We now use “Unix-like” to describe systems

And now, what is Unix???

- Unix was an earlier operating system
- Linux and other systems are heavily influenced by Unix
- We now use “Unix-like” to describe systems
  - They follow the same general ideas as Unix

And now, what is Unix???

- Unix was an earlier operating system
- Linux and other systems are heavily influenced by Unix
- We now use “Unix-like” to describe systems
  - They follow the same general ideas as Unix
  - This means most things (commands, properties) carry over!

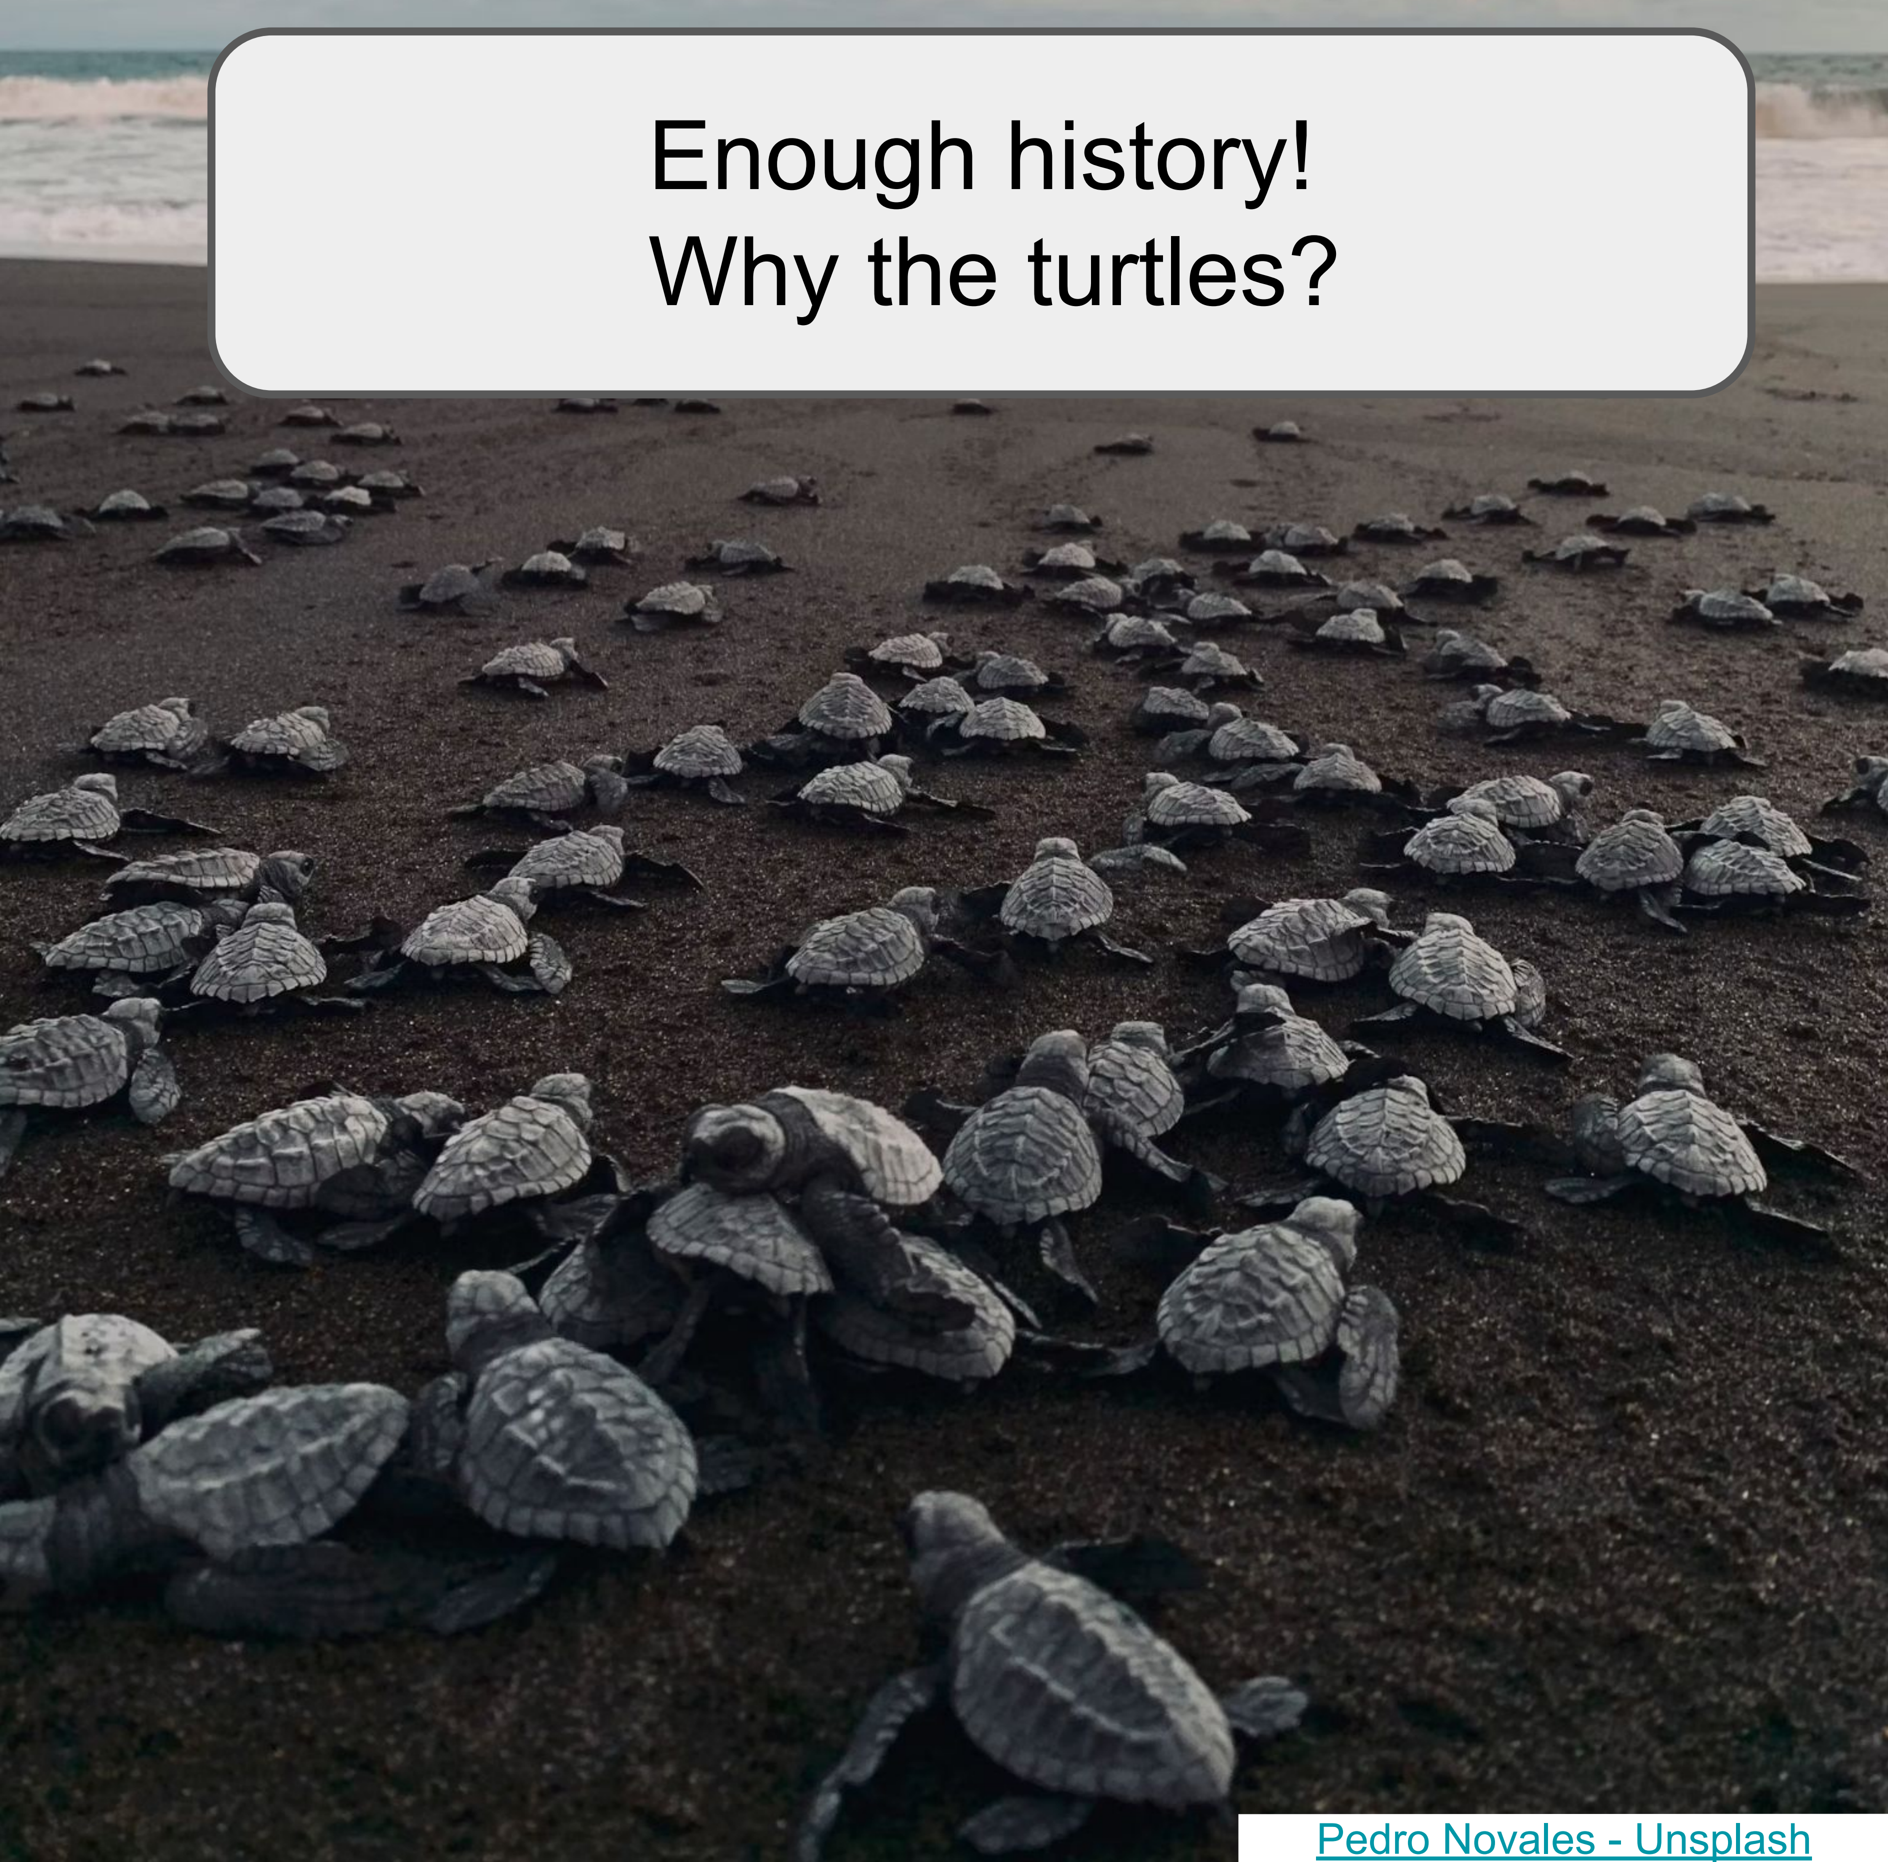
Enough history!
Why the turtles?



Pedro Novales - Unsplash

What is this called?

What is this called?

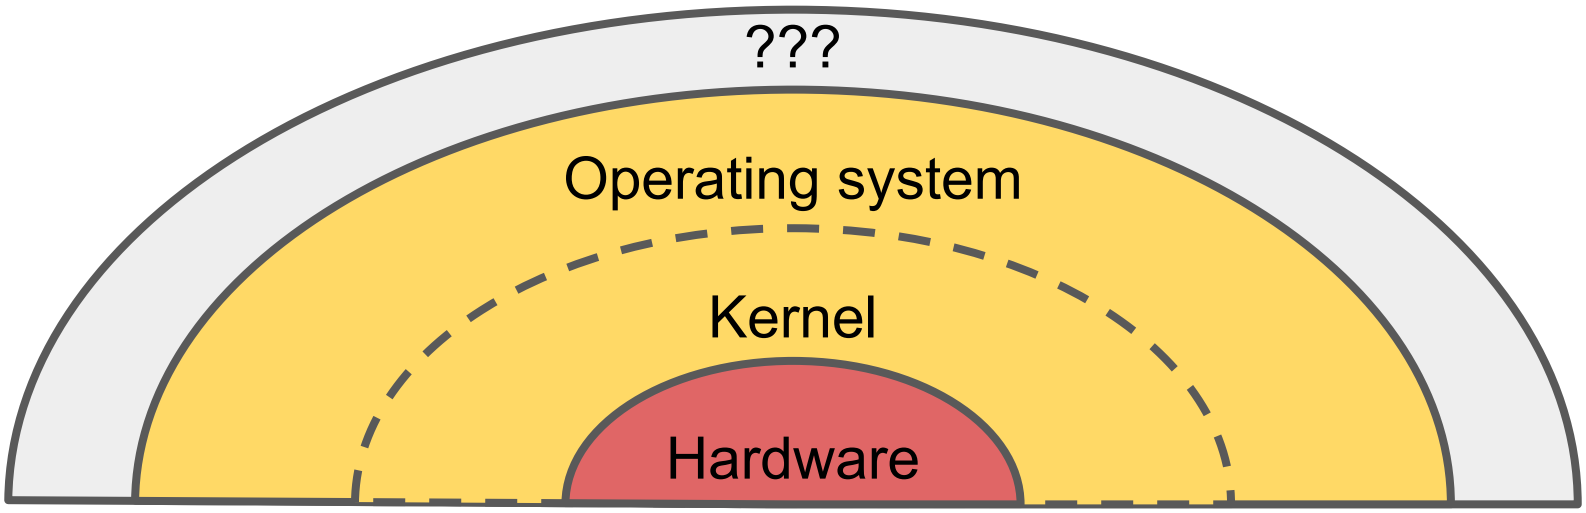
A terminal

But what’s going on in here?

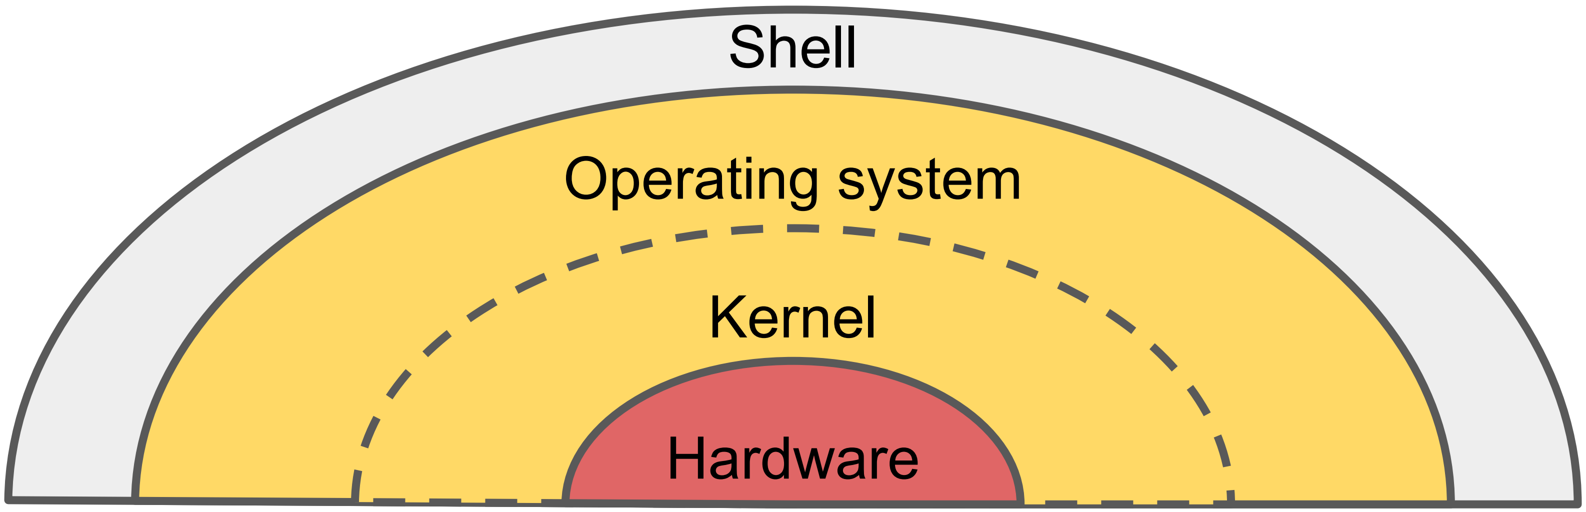
But what's going on in here?

We are running a ***shell***

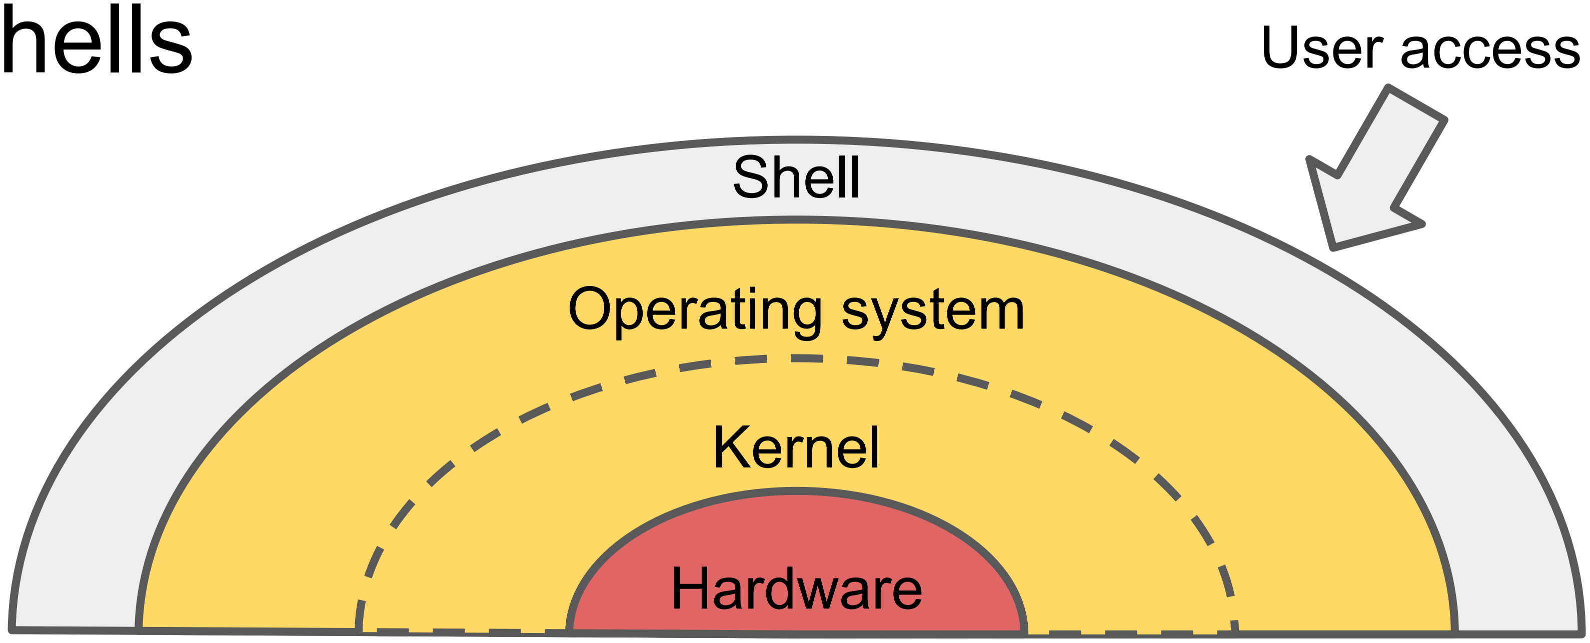
Shells



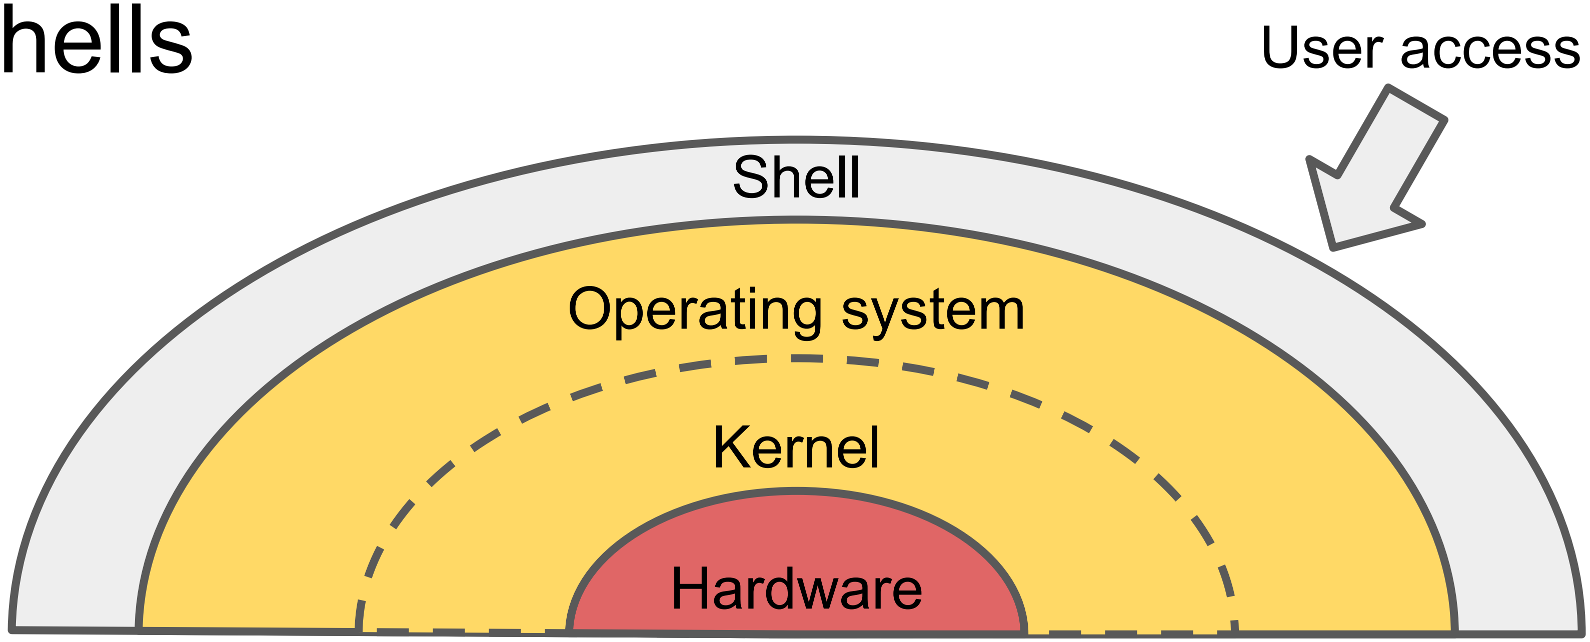
Shells



Shells



Shells



- We can check what shell we're using with `echo $0`

What if I want to connect to another machine?

What if I want to connect to another machine?

`ssh` - ***S***ecure ***SH***ell

What if I want to connect to another machine?

`ssh` - ***S***ecure ***SH***ell

ssh allows us to securely connect to a remote shell

What if I want to connect to another machine?

`ssh` - ***S**ecure **SH**ell*

ssh allows us to securely connect to a remote shell

usage:

```
ssh username@address
```

What if I want to connect to another machine?

`ssh` - ***S***ecure ***SH***ell

ssh allows us to securely connect to a remote shell

usage:

```
ssh username@address
```

For connecting to the EOS machines:

```
ssh username@eos01.cis.gvsu.edu
```

What if I want to connect to another machine?

`ssh` - ***S***ecure ***SH***ell

ssh allows us to securely connect to a remote shell

usage:

```
ssh username@address
```

For connecting to the EOS machines:

```
ssh username@eos01.cis.gvsu.edu
```

You can log onto different machines in the lab by changing this number!
